#Preface

This is a quarto book

2 Ecosystem Status Report for the U.S. Caribbean

3 1. Executive Summary

4 2. Introduction

Ecosystem-based management of fisheries and other marine resources has emerged as a priority in the U.S. (EPAP 1999, Fluharty et al. 2006, McFadden and Barnes 2009, NOAA 2016) and elsewhere (Browman et al. 2004, Sainsbury et al. 2014, Walther and Möllmann 2014, Long et al. 2015). The NOAA National Marine Fisheries Service (NOAA Fisheries) defines ecosystem-based fisheries management (EBFM) as ‘a systematic approach to fisheries management in a geographically specified area that contributes to the resilience and sustainability of the ecosystem; recognizes the physical, biological, economic, and social interactions among the affected fishery-related components of the ecosystem, including humans; and seeks to optimize benefits among a diverse set of societal goals’ (NOAA 2016).

4.1 2.1 Indicator selection

This report relied on both previously identified proposed indicators as well as expert vetting to select a suite of indicators that best address the fishery management plan (FMP) objectives for the U.S. Caribbean. The CFMC’s Science and Statistical Committee, as well as the region’s Ecosystem-Based Fishery Management Technical Advisory Panel (EBFM TAP), recently completed a series of conceptual models linking key components of the ecosystem and human activities related to fishing. This report used these conceptual models as a starting list of proposed indicators and matched the indicators to answer FMP objectives when possible. For those objectives that did not have an immediate conceptual model-identified indicator, this report used a decision matrix process for expert vetting (Fig x).

insert fig

This decision matrix was composed of a list of proposed indicators compiled from the conceptual models as well as proposed indicators provided via expert input. These potential indicators were vetted and edited by expert small working groups, who then scored a decision matrix (Fig. x) of potential indicators against the following decision criteria: long term data availability, measurability, sensitivity to environmental changes, specificity, spatial and temporal scalability, relevance to specific FMP objectives, and responsiveness to management actions.

4.2 2.2 Notes on interpreting time series figures

Time series data are plotted in a standardized format for ease of interpretation (e.g., Fig. 2.1). The x-axis represents the temporal dimension, which may be monthly, yearly, or irregular time steps, and the y-axis represents the indicator value in units specified in the axis label. The dashed horizontal line represents the mean indicator value across the entire time series, and the solid horizontal lines denote the mean plus or minus one standard deviation. Red shaded areas and green shaded areas show years for which the indicator value is below or above one standard deviation from the mean, respectively. The blue vertical shaded box highlights the last five years of indicator values, over which additional metrics are calculated. Black circles to the right of each figure indicate whether the indicator values over the last five years are greater (plus sign), less than (minus sign), or within (solid circle) one standard deviation from the mean of the overall time series. Arrows to the right of each figure indicate whether the least squares linear fit through the last five years of data produces a positive or negative slope that is greater than one standard deviation (upward or downward arrows respectively), or less than one standard deviation (left-right arrow).

5 3. Fishery management plan objectives and conceptual models

This report's indicator selection process sought to select indicators that corresponded to the island based fishery management plan (FMP) objectives in order to track performance, and also selected indicators related to risks to meeting these management objectives. The following figure shows indicators selected per FMP objective. Indicators were also sourced and considered from the conceptual model exercise completed by the Council's Science and Statistical Committee and District Advisory panels, which began in 2019. Top scored connections in ecosystem components were considered in the ESR indicator suite as well (Rivera et al, in publication).

6 4. Risks to meeting fishery management objectives

6.0.1 Degree heating weeks

Indicator 1

6.0.2 Ocean acidification via aragonite saturation state

Indicator 2

6.0.3 Hurricane activity

Indicator 3

6.0.4 Turbidity

Indicator 4

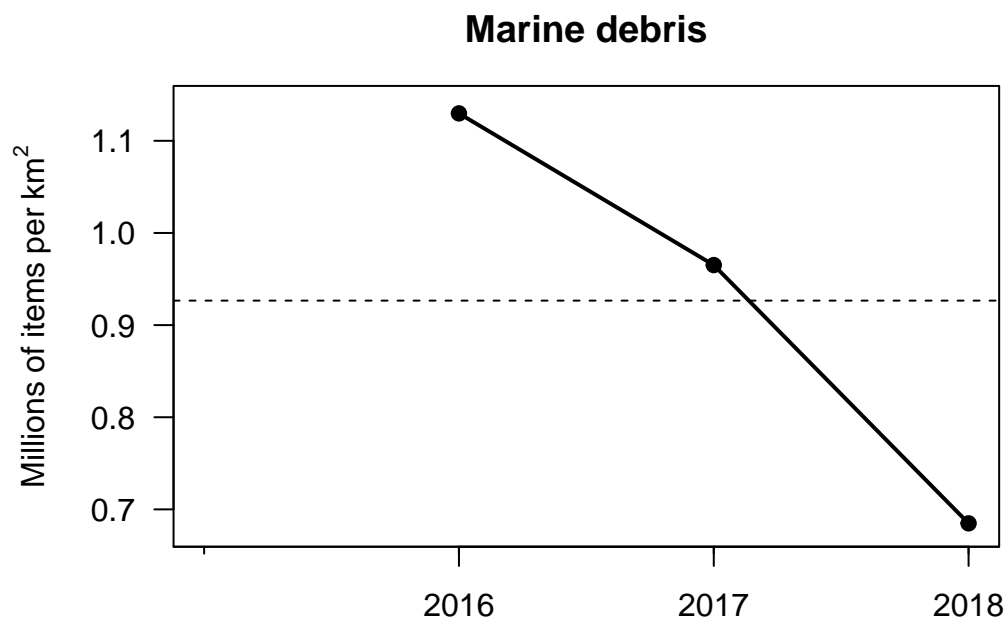

```
# {r, message = FALSE, warnings = FALSE} #load("indicator_objects/turbidity.RData")
#plotIndicatorTimeSeries(inddata, trendAnalysis = F) #
```

6.0.5 Sea surface temperature

Indicator 5

6.0.6 Marine debris

Indicator 6

6.0.7 Identified point source pollution sites

Indicator 7

6.0.8 Primary productivity via ocean color

Indicator 8

```

7 {r, message = FALSE, warnings = FALSE}
#
load("indicator_objects/carib_Ch1.RData")
# plotIndicatorTimeSeries(inddata,
trendAnalysis = F) #

```

7.0.1 Coastal development via land cover

Indicator 9

7.0.2 Number of major earthquakes

Indicator 10

7.0.3 Fishery/market disturbance indicator (maybe belongs in socioeconomic health)

Indicator 11

7.0.4 Sargassum inundation

Indicator 12

```
8 {r} #  
  load("indicator_objects/Sargassum.RData")  
  # plotIndicatorTimeSeries(inddata,  
  coltoplot = 1:2, plotrownum = 2,  
  trendAnalysis = F, sublabel = T) #
```

9 {r} #

```
load("indicator_objects/sargassum_innundation_m  
# plotIndicatorTimeSeries(inddata,  
coltoplot = 1:2, plotrownum = 2,  
trendAnalysis = F, sublabel = T) #
```

9.0.1 Tourism via hotel occupancy

Indicator 13

```
10 {r, message = FALSE, warnings =  
    FALSE} #  
    load("indicator_objects/hotel_occupancy_rates_  
    # plotIndicatorTimeSeries(inddata,  
    trendAnalysis = F) #
```

```
11 {r, message = FALSE, warnings =  
    FALSE} #  
    load("indicator_objects/hotel_occupancy.RData"  
    # plotIndicatorTimeSeries(inddata,  
    trendAnalysis = F) #
```

11.0.1 Population density

Indicator 14

11.0.2 Population change

Indicator 15

12 5. Tracking performance toward fishery management objectives

12.1 5.1 Food production

12.1.1 Fishery independent surveys of economically important species

Indicator 16

12.1.2 Commercial landings

Indicator 17

12.1.3 Maximum length and size structure

Indicator 18

12.1.4 Changes in target species / landing composition

Indicator 20

12.2 5.2 Socioeconomic health

12.2.1 Total, lobster and conch revenues

Indicator 21

12.2.2 Total, lobster and conch trips

Indicator 22

12.2.3 Ocean economy employment and wages

Indicator 23

12.2.4 GDP

Indicator 24

12.2.5 Unemployment

Indicator 25

12.3 5.3 Equity

12.3.1 Gini coefficient for distribution of landings and revenue

Indicator 26

12.3.2 Commercial fishing community engagement and reliance

Indicator 27

12.4 5.4 Engagement and participation

12.4.1 Recreational fishing engagement and participation

Indicator 28

12.4.2 Commercial fishing engagement and participation

Indicator 29

12.5 5.5 Bycatch reduction

12.5.1 Changes in gear type

Indicator 30

12.6 5.5 Governance

12.6.1 Number of seasonal closures implemented

Indicator 31

12.6.2 Number of education and outreach events

Indicator 32

12.6.3 Number of enforcement actions

Indicator 33

12.7 5.6 Protection of ecosystems

12.7.1 Percent coral cover and coral species richness

Indicator 34

12.7.2 Coral species diversity

Indicator 35

13 6. Integrated ecosystem perspectives

Stoplight plot

14 7. Research Recommendations

14.1 Data gaps

15 8. Acknowledgements

16 9. References

17 10. Data source table
